Abstract – Our ability to quantify the uptake of carbon dioxide (CO₂) by the oceans is under threat, at a time when the importance of constraining the uptake is well recognized by efforts such as the WMO Global Greenhouse Gas Watch⁴ and the UN Global Stocktake. SOCAT-based estimates have shown that the oceans take up a quarter of the CO₂ emissions from human activity⁵, thus helping to mitigate climate change and providing a way to balance the Earth’s carbon budget. The latest update of the community-led Surface Ocean CO₂ Atlas (www.socat.info), version 2023, has delivered 35.6 million, quality-controlled, in situ surface ocean CO₂ fugacity (fCO₂) measurements collected between 1957 and 2022 with an estimated accuracy of < 5 μatm. The SOCAT synthesis products and the fCO₂ measurements in them are key for quantification of ocean CO₂ uptake at a monthly timescale, providing vital information for climate policy. However, the open ocean data collection effort has dramatically declined since 2017. SOCAT itself is at immediate risk upon losing its European data management team, while facing persistent funding shortfalls. The need for accurate knowledge of ocean CO₂ uptake and its variation now and in the future makes sustained funding of accurate surface ocean CO₂ observations and their synthesis imperative.

Key features
- In situ surface ocean CO₂ measurements from ships, moorings and autonomous surface vehicles for the global ocean and coastal seas from 1957 to 2022.
- 35.6 million CO₂ values with an estimated accuracy of < 5 μatm in the main synthesis and gridded products (Fig. 1b, 2a, 2b)
- 7.2 million CO₂ values with a lower accuracy of 5 - 10 μatm are separately available but are not in the main synthesis and gridded products.
- Community-led, expert quality-control (QC) and synthesis
- Annual, public release
- Online viewers and data download (www.socat.info)

Outlook
- v2024 data submission by 15/01/2024, QC by 29/03/2024
- Automation of metadata upload
- Component of the Sustainable Development Goal (SDG) 14.3 federated data system

At risk: Data collection & SOCAT synthesis
- Dramatic reduction in open ocean data collection after 2017, as evident from number of monthly gridded CO₂ values (Fig. 2b).
- SOCAT at high risk by the closure of its European data management node and chronic funding shortfalls for coordination, expert quality-control and data management.
- Our ability to resolve the Global Carbon Budget⁶ and future ocean uptake of CO₂ emissions is under threat.

Scientific findings, applications and impact
- Quantification of ocean CO₂ uptake⁵,¹⁴ and acidification⁶,⁷,³,³,⁷,⁹,¹³
- Evaluation of climate models⁶ and sensor data⁷,⁷,¹³
- Data gaps addressed through interpolation schemes⁶,³,³,¹³,¹³,¹³
- Ocean CO₂ uptake estimated from SOCAT-based products and models differs by ~0.8 Pg C yr⁻¹ for the year 2021⁻¹ (Fig. 3).
- Cited in hundreds of peer-reviewed scientific articles and reports
- Critical policy info from value chain² (Fig. 4).
- Key for WMO Global Greenhouse Gas Watch⁵, UN Global Stocktake, Decade of Ocean Science and SDGs 13 and 14
